Illinois Statewide Surgical Site Infections Report (SSI)

Coronary Artery Bypass Graft Surgery (CABGS)

Health Care Associated Infections

Hospitals in Illinois are participating in programs to reduce the number of infections acquired during hospital stays. While it is difficult to reduce infections to zero, following specific protocols can greatly reduce the risk. The Hospital Report Card Act (Illinois Public Act 93-563) requires Illinois hospitals to report surgical site infections occurring following coronary artery bypass graft surgery (CABGS) or knee arthroplasty (knee replacement) (KPRO). Comparison summary data for SSIs, expressed as a Standardized Infection Ratio (SIR), are presented by hospital for CABGS and KPRO surgery, respectively. Interpretation of these summary measures is provided.

Surgical Site Infection (SSI) Standardized Infection Ratio (SIR^a)

Reportable Period: July 1, 2010- June 30, 2011

Coronary Artery Bypass Graft Surgery (CABGS)

STATEWIDE

Hospital	City	Observed [O] Number of SSIs ^b	Number of CABGS Performed ^c	Statistically "Expected" [E] Number of SSIs ^d	Hospital-specific SIR ^e =O/E	95% Confidence Interval [CI] ^f		Statistical Interpretation

^a The Standardized Infection Ratio (SIR) is a summary measure used to compare the surgical site infection (SSI) experience amongst a group of patients undergoing a specific procedure in a given hospital to that of a standard population. It is the observed number of infections divided by the expected number of infections.

^b Excludes Superficial Incisional Secondary (SIS) and Deep Incisional Secondary (DIS) SSIs.

^c Reporting on too few procedures is a risk to patient confidentiality. If there are twenty (20) or fewer procedures performed, the report for the number of infections will be deferred until there are more procedures performed.

^d Please note that the "expected" number of infections does not mean that you expect to get an infection when you are undergo a surgical procedure.

^e If the expected number of infections is < 1.0 , the SIR is not calculated because it does not meet the minimum requirement for precision.

^f The confidence interval for a hospital's standardized infection ratio (SIR) is the range of possible SIRs within which there is 95% confidence that the real SIR for that hospital lies, given the number of infections and procedures that were observed in that hospital in a specific time period.

^g The lower bound of the confidence interval is calculated only if the infection count > 0 .

* 20 or fewer CABGS performed at this hospital.

** Zero Infections, but too few procedures performed to determine whether this is significantly better than expected.

Interpretation of the SIR: All conclusions are based on the assumption that the hospital's surgical population is similar to the NHSN pooled patient population.

If the 95% confidence interval includes 1.0, the hospital's infection rate is similar (not significantly different) from "expected" (predicted).

If the SIR is greater than 1.0 and the 95% confidence interval does not include 1.0, the hospital's infection rate is significantly higher than "expected" (predicted).

If the SIR is less than 1.0 and the 95% confidence interval does not include 1.0, the hospital's infection rate is significantly lower than "expected" (predicted). All conclusions are based on the assumption that the hospital's patient population is similar to the NHSN pooled patient population.
